

ExpertusONE API Integration Architecture

Connect your learning programs to the business solutions that keep your organization humming with ExpertusONE's flexible, extendable API-based integration architecture. Whether you're connecting to your HRIS, Employee Engagement solution, CRM, or BI, ExpertusONE allows you to quickly and efficiently link your systems with an industry leading set of robust and flexible connectors.

ExpertusONE's Approach to Extend the Reach of Your LMS

- **Platform agnostic**—Easily create comprehensive, two way integrations between ExpertusONE and applications, up- and downstream, no matter the technology.
- **Connections across all LMS actions**—Integration support for all LMS functionality, not just basic administration. We also create new APIs in parallel with new features so that you can take advantage of connections as soon as they're released.
- **Create custom workflows**—Use APIs to create your own workflows and interfaces. Because our APIs can support nearly any function, you can create your own interface anywhere you need.

Deliver information efficiently

Use high-performance APIs to sync data across systems, update skills, manage chargebacks, or track certifications seamlessly.

Gain complete insight

Leverage APIs to build reports, integrate BI tools, or feed data into your analytics platform or warehouse.

Place learning where needed

Access LMS directly from external systems like Salesforce to boost learner engagement and improve compliance.

Use our APIs to:

- Auto-provision users when they join your community or register in your website
- Automatically add users to their respective LMS groups
- Register and launch content externally without having to visit the LMS
- Customize the user learning experience by designing and delivering custom solutions
- Synchronize training completion data with external applications
- Tie learning insights with broader business goals

ExpertusONE APIs perform both pull (read) and push (create, edit, and delete) data actions and use or support:

- Open Authentication standard (OAuth)
- HTTP GET and POST methods
- XML and JSON frameworks

Designed to Perform

Our APIs are designed to perform, whether you're moving data between systems, or using them to create your own app. With our flexible, extensible architecture you'll get:

- **High throttling thresholds**—We don't limit the total number of API calls you can make in an hour or in a day, while also allowing you to use multiple APIs simultaneously and maintain high performance levels.
- **Efficiently designed calls**—Instead of requiring multiple calls to complete one single task, our APIs are bundled so that only one call is required, ensuring high speed and high performance integrations.
- **An API simulator**—The ExpertusONE API simulator allows you to test your use of APIs, especially if you're using them to build your own app, to ensure that everything performs optimally.

Fuel Your Learning Transformation with ExpertusONE APIs

As part of the industry's most modern learning system, ExpertusONE's advanced APIs seamlessly and efficiently connect your LMS to your entire enterprise to ensure the flow of data and insight across your systems & applications. That's another way that we're helping today's leading global enterprise companies with zero-compromise learning and training.
